3-substituted 5,6-diaryl-pyrazine-2-carboxamide and -2-sulfonamide derivatives as CB₁ modulators.

Field of invention

The present invention relates to certain 3-substituted-4,5-diarylpyrazine-2-carboxamides

General Experimental Procedures

Mass spectra were recorded on either a Micromass ZQ single quadrupole or a Micromass LCZ single quadrupole mass spectrometer both equipped with a pneumatically assisted electrospray interface (LC-MS). ¹H NMR measurements were performed on either a Varian Mercury 300 or a Varian Inova 500, operating at ¹H frequencies of 300 and 500 MHz respectively. Chemical shifts are given in ppm with CDCl₃ as internal standard. CDCl₃ is used as the solvent for NMR unless otherwise stated. Purification was performed on a semipreparative HPLC with a mass triggered fraction collector, Shimadzu QP 8000 single quadrupole mass spectrometer equipped with 19 x 100 mm C8 column. The mobile phase used was, if nothing else is stated, acetonitrile and buffer (0.1 M NH₄Ac:acetonitrile 95:5).

For isolation of isomers, a Kromasil CN E9344 (250 x 20 mm i.d.) column was used. Heptane:ethyl acetate:DEA 95:5:0.1 was used as mobile phase (1 ml/min). Fraction collection was guided using a UV-detector (330 nm).

1,2-bis(4-chlorophenyl)-2-hydroxyethanone, (90 g, 0.320 mol) and nitric acid (170 ml) were heated at 100°C until the evolution of nitrogen oxides ceased after 4 hours. The reaction mixture was cooled, and water (250 ml) was carefully added. The crude product was filtered, washed several times with water and dried under reduced pressure to give a yellow solid (40.4 g, 45%).

¹H NMR (500 MHz) δ 7.94 (d, 4H), 7.53 (d, 4H).

c) 5,6-bis(4-chlorophenyl)pyrazine-2,3-dicarbonitrile

The reaction mixture was cooled, and water was added. The precipitate was filtered and washed with ethanol and then ether. The crude product was dissolved in DCM and treated with activated charcoal, then filtered through celite. After evaporation, a solid was formed and recrystallized from DCM/ethanol to give a pale yellow solid (17.3 g, 69%).

The reaction mixture was heated at reflux for 2h, cooled and washed once with diethyl ether and acidified to pH 4 with 2M HCl. The precipitate was collected through a filter, washed with water and dried under reduced pressure to give the crude product. The crude product was converted to dimethyl ester by refluxing with hydrogen chloride/methanol (100 ml) and purified by HPLC, giving 12.85 g of the methyl ester. Example 10

20 3-(tert-butoxymethyl)-5,6-bis(4-chlorophenyl)-N-piperidin-1-ylpyrazine-2-carboxamide

Step A: 5,6-bis(4-chlorophenyl)-3-(ethoxycarbonyl)pyrazine-2-carboxylic acid
2,3-bis(4-chlorophenyl)furo[3,4-*b*]pyrazine-5,7-dione (4.826 g, 13.00 mmol) was suspended in EtOH (160 mL). The suspended material gradually went into solution. After stirring overnight the solvents were evaporated. In order to remove any remaining EtOH the residue was suspended in toluene, whereupon the toluene was evaporated. This was repeated two more times and finally yielded pure 5,6-bis(4-chlorophenyl)-3-(ethoxycarbonyl)pyrazine-2-carboxylic acid as a yellowish solid (5.425 g, 13.00 mmol, quant.).

¹H NMR (500 MHz, CDCl₃) δ 7.50-7.34 (m, 8 H), 4.57 (q, 7.0 Hz, 2H), 1.46 (t, 7.0 Hz, 3H).

Step B: Ethyl 5,6-bis(4-chlorophenyl)-3-(hydroxymethyl)pyrazine-2-carboxylate

5 5,6-bis(4-chlorophenyl)-3-(ethoxycarbonyl)pyrazine-2-carboxylic acid (0.562 g, 1.35 mmol) was dissolved in dry THF (13 mL) under Ar. Upon cooling to -20°C triethylamine (0.191 g, 1.89 mmol) was added. Finally, *iso*-butylchloroformate (0.221 g, 1.62 mmol) was added dropwise during ca 5 min. After stirring at -20°C for 1 h, the temperature was adjusted to 0°C. After stirring at 0°C for another hour the reaction mixture was recooled to
10 -20°C. At this point a small volume (1.7 mL, corresponding to ca 3 eq.) of a pre-prepared solution of sodiumborohydride (0.940 g, 24.8 mmol) in pre-chilled H₂O (10 mL) was added dropwise during ca 5 min to the reaction mixture. Gas evolution could be observed and at the same time the solution became orange-coloured. After stirring at -20°C for ca 1 h the reaction was quenched by the dropwise addition of HCl (aq., 2 M, 5 mL). The
15 reaction mixture was allowed to stir for 1 h (during that time the temperature increased to -10°C) before it was transferred to a separation funnel with the aid of dichloromethane (100 mL). H₂O (100 mL) was added. The organic phase was separated and the aqueous phase was extracted further with dichloromethane (3 x 30 mL). The collected organic phases were washed with brine (100 mL) before drying with MgSO₄. Upon evaporation of the
20 solvents the obtained residue was dissolved in a minimum volume of dichloromethane-heptane (1:1) and applied on the top of a pre-packed column (silica gel; dichloromethane-heptane 1:1). The products were eluted with two successive gradients: firstly, dichloromethane-heptane 50-100 % and, secondly, EtOAc-dichloromethane 0-6 %. Ethyl 5,6-bis(4-chlorophenyl)-3-(hydroxymethyl)pyrazine-2-carboxylate was obtained as a
25 yellowish viscous oil (0.434 g, 1.08 mmol, 80 %).

¹H NMR (500 MHz, CDCl₃) δ 7.50-7.44 (m, 4H), 7.38-7.32 (m, 4H), 5.17 (d, 5.7 Hz, 2H), 4.52 (q, 7.3 Hz, 2H), 4.25 (t, 5.7 Hz, 1H). 1.48 (t, 7.0 Hz, 3H).

Step C ethyl 3-(tert-butoxymethyl)-5,6-bis(4-chlorophenyl)pyrazine-2-carboxylate

tert-butyl 2,2,2-trichloroethanimidoate (516 mg, 2.36 mmol) and boron trifluoride diethyl etherate (56 mg, 0.39 mmol) was added at room temperature to a solution of ethyl 5,6-bis(4-chlorophenyl)-3-(hydroxymethyl)pyrazine-2-carboxylate (866 mg, 2.15 mmol) in methylene chloride (0.2 ml) and cyclohexane (5 ml). Step A: Ethyl 5,6-bis(4-chlorophenyl)-3-formylpyrazine-2-carboxylate

Ethyl 5,6-bis(4-chlorophenyl)-3-(hydroxymethyl)pyrazine-2-carboxylate (0.660 g, 1.64 mmol) was dissolved in dichloromethane (16 mL) and Dess-Martin periodinane (0.729 g, 1.72 mmol) was added in one portion. After stirring for 2 h at ambient temperature a TLC analysis indicated complete consumption of the starting material. Consequently, the reaction was quenched by the sequential addition of $\text{Na}_2\text{S}_2\text{O}_3$ (aq., 0.2 M, 4 mL) and NaHCO_3 (aq., sat., 4 mL). The resulting mixture was stirred vigorously for 30 min and then allowed to stand overnight. Next morning the mixture was transferred to a separation funnel with the aid of dichloromethane (100 mL). $\text{Na}_2\text{S}_2\text{O}_3$ (aq., 0.2 M, 15 mL) and NaHCO_3 (aq., sat., 15 mL) were added. The organic phase was separated and the aqueous phase was extracted further with dichloromethane (2 x 30 mL). The collected organic phases were washed with H_2O (25 mL) and brine (75 mL) before drying with MgSO_4 . Upon evaporation of the solvents the obtained residue was purified by column chromatography (silica gel, EtOAc-heptane 0-30 %) to yield ethyl 5,6-bis(4-chlorophenyl)-3-formylpyrazine-2-carboxylate as a yellowish, viscous oil (0.519 g, 1.29 mmol, 79 %).

The cooling bath was replaced by an ice bath and the mixture was stirred for 10 minutes at 0 degrees. A dark cherry red clear solution was formed. Cooling again to -78 degrees and addition of ethyl 5,6-bis(4-chlorophenyl)-3-formylpyrazine-2-carboxylate (112 mg, 0.28 mmol) in THF (2 ml). The reaction was kept at -78 for 1 hr and then allowed to attain room temperature. The mixture was diluted with toluene and washed with water, dilute hydrochloric acid, bicarbonate solution, and water. Evaporation of the solvent and purification by preparative HPLC gave 56 mg (43%) of the target compound.

Ethyl 5,6-bis(4-chlorophenyl)-3-(hydroxymethyl)pyrazine-2-carboxylate (1.44 g, 3.58 mmol) was dissolved in dichloromethane (18 mL). Iodomethane (5.086 g, 35.8 mmol) and tetrabutylammonium hydrogensulphate (0.122 g, 0.358 mmol) were added and then, NaOH (aq., 50 % w/w, 18 mL). The mixture quickly adopted a brightly red colour, which then gradually faded with time. Vigorous stirring overnight. The following morning the reaction mixture was cooled to 0 °C before HCl (aq., 4 M, 200 mL) was slowly added (dropwise). The resulting mixture was transferred to a separation funnel with the aid of dichloromethane (100 mL). The organic phase was separated and the aqueous phase was extracted further with dichloromethane (4 x 100 mL). The collected organic phases were dried with MgSO₄. Upon evaporation of the solvents the obtained residue was purified by column chromatography (silica gel, EtOAc-heptane, 0-40 %; upon reaching 40 % EtOAc formic acid was added to the eluent, 0.5 % v/v) to yield a mixture of 5,6-bis(4-chlorophenyl)-3-(methoxymethyl)pyrazine-2-carboxylic acid and 5,6-bis(4-chlorophenyl)-3-(1-methoxyethyl)pyrazine-2-carboxylic acid (1.130 g) as a brownish semi-solid

Step B Methyl 5,6-bis(4-chlorophenyl)-3-(1-methoxyethyl)pyrazine-2-carboxylate

The mixture from step A (1.13 g, 2.90 mmol) was dissolved in dichloromethane (28 mL), whereupon MeOH (7 mL) was added. Trimethylsilyl diazomethane (1.8 mL, 2.0 M in hexanes, 3.6 mmol) was added dropwise at such a rate as to keep the evolution of nitrogen under control. Stirring overnight at ambient temperature. Next morning silica gel (ca 5 g) was added to the reaction mixture and the solvents were evaporated. The obtained solid residue was put on top of a pre-packed column (silica gel, heptane) and the product was eluted by two rounds of column chromatography: 1) silica gel, EtOAc-heptane, 0-25 %, methyl 5,6-bis(4-chlorophenyl)-3-(1-methoxyethyl)pyrazine-2-carboxylate elutes slightly faster than methyl 5,6-bis(4-chlorophenyl)-3-(methoxymethyl)pyrazine-2-carboxylate; 2) silica gel, dichloromethane-heptane, 0-100 %. Methyl 5,6-bis(4-chlorophenyl)-3-(1-methoxyethyl)pyrazine-2-carboxylate (9 mg, 0.02 mmol, 0.7 %) was obtained as a colourless viscous oil.

Upon cooling to 0 °C trimethylaluminium (2.5 mL, 2 M in toluene, 5.0 mmol) was added dropwise. After the addition of Me₃Al was complete the ice bath was removed and the mixture was allowed to stir for 3 h at ambient temperature; consequently, a ca 0.67 M solution of aluminium amide was obtained. A part of this
10 solution (0.75 mL, 0.50 mmol, corresponding to ca 25 eq.) was added to methyl 5,6-bis(4-chlorophenyl)-3-(1-methoxyethyl)pyrazine-2-carboxylate (9 mg, 0.02 mmol), which had been placed in a dry flask under Ar. Heating at 50 °C overnight. Next morning the reaction mixture was cooled to 0 °C and toluene (1 mL) was added before HCl (aq., 2 M, 10 mL) was slowly added (dropwise). The obtained mixture was transferred to a separation funnel
15 with the aid of dichloromethane (30 mL) and water (30 mL). The organic phase was separated and the aqueous phase was extracted further with dichloromethane (3 x 10 mL). Ethyl 5,6-bis(4-chlorophenyl)-3-(hydroxymethyl)pyrazine-2-carboxylate (1.44 g, 3.58 mmol) was dissolved in dichloromethane (18 mL). iodomethane (5.086 g, 35.8 mmol) and tetrabutylammonium hydrogensulphate (0.122 g, 0.358 mmol) and then NaOH (aq., 50 % w/w, 18 mL) were added. The solution quickly adopted a brightly red colour, which then gradually faded with time. Vigorous stirring overnight. The following morning the reaction mixture was cooled to 0 °C before HCl (aq., 4 M, 200 mL) was slowly added (dropwise). The resulting mixture was transferred to a separation funnel with the aid of dichloromethane (100 mL). The organic phase was separated and the aqueous phase was extracted further with dichloromethane (4 x 100 mL). The collected organic phases were dried with MgSO₄. Upon evaporation of the solvents the obtained residue was purified by column chromatography (silica gel, EtOAc-heptane, 0-40 %; upon reaching 40 % EtOAc formic acid was added to the eluent, 0.5 % v/v) to yield crude 5,6-bis(4-chlorophenyl)-3-(methoxymethyl)pyrazine-2-carboxylic acid (1.130 g) as a brownish semi-solid. The material was used without further purification in the next step.

Step B Methyl 5,6-bis(4-chlorophenyl)-3-(methoxymethyl)pyrazine-2-carboxylate

Step A Ethyl 5,6-bis(4-chlorophenyl)-3-[(4,4-difluoropiperidin-1-yl)methyl]pyrazine-2-carboxylate

Ethyl 5,6-bis(4-chlorophenyl)-3-formylpyrazine-2-carboxylate (92 mg, 0.23 mmol) was dissolved in 1,2-dichloroethane (0.8 mL) and 4,4-difluoropiperidine (56 mg, 0.46 mmol) was added. Finally, sodium triacetoxyborohydride (73 mg, 0.34 mmol) was added and the reaction mixture was allowed to stir overnight at ambient temperature. The following morning the reaction mixture was transferred to a separation funnel with the aid of EtOAc (30 mL) and NaHCO₃ (aq., sat., 30 mL). The organic phase was separated and the aqueous

phase was extracted further with EtOAc (3 x 10 mL). The collected organic phases were washed with water (15 mL) and brine (30 mL) before drying with MgSO₄. Upon evaporation of the solvents the obtained residue was purified by column chromatography (silica gel, EtOAc-heptane, 0-20 %) to yield ethyl 5,6-bis(4-chlorophenyl)-3-[(4,4-difluoropiperidin-1-yl)methyl]pyrazine-2-carboxylate (89mg, 0.18 mmol) as a colourless sticky oil.

¹H NMR (500 MHz, CDCl₃) δ 7.50-7.40 (m, 4H), 7.38-7.30 (m, 4H), 4.48 (q, 2H, J=7.2 Hz), 4.05 (s, 2H), 2.72-2.54 (m, 4H), 2.05-1.90 (m, 4H), 1.47 (t, 3H, J=7.1 Hz).

Step B 5,6-bis(4-chlorophenyl)-3-[(4,4-difluoropiperidin-1-yl)methyl]-N-piperidine-1-ylpyrazine-2-carboxamide

The hydrochloride of piperidin-1 amine (0.683 g, 5.00 mmol) was suspended in dry toluene (5.0 mL) under Ar. Upon cooling to 0 °C trimethylaluminium (2.5 mL, 2 M in toluene, 5.0 mmol) was added dropwise. After the addition of Me₃Al was complete the ice bath was removed and the mixture was allowed to stir for 3 h at ambient temperature; consequently, a ca 0.67 M solution of aluminium amide was obtained. A part of this solution (2.0 mL, 1.3 mmol, corresponding to ca 7.4 eq.) was added to ethyl 5,6-bis(4-chlorophenyl)-3-[(4,4-difluoropiperidin-1-yl)methyl]pyrazine-2-carboxylate (0.092 g, 0.18 mmol), which had been placed in a dry flask under Ar. Heating at 50 °C for 18 h. Upon cooling to 0 °C toluene (ca 2 mL) was added before HCl (aq., 2 M, 2 mL) was slowly added (dropwise). The obtained mixture was allowed to stir at 0 °C for ca 3 h before it was transferred to a separation funnel with the aid of dichloromethane (30 mL) and water (30 mL). The pH of the aqueous phase was adjusted to 6-7 with NaOH (aq., 2 M). The organic phase was separated and the aqueous phase was extracted further with dichloromethane (3 x 10 mL). The collected organic phases were washed with water (10 mL) and brine (30 mL) before drying with MgSO₄. Upon evaporation of the solvents the obtained residue was purified by two rounds of column chromatography: 1) silica gel, EtOAc-heptane, 0-50 %; 2) silica gel, EtOAc-dichloromethane, 0-30 %. This yielded 5,6-bis(4-chlorophenyl)-3-[(4,4-difluoropiperidin-1-yl)methyl]-N-piperidine-1-ylpyrazine-2-carboxamide (82 mg, 0.15 mmol, 80 %) as a viscous, yellowish oil.

¹H NMR (500 MHz, CDCl₃) δ 8.51 (br s, 1H, N-H), 7.48-7.40 (m, 4H), 7.36 (d, 2H, J=8.4 Hz), 7.33 (d, 2H, J=8.4 Hz), 4.36 (s, 2H), 2.98-2.86 (m, 4H), 2.86-2.78 (m, 4H), 2.10-1.94 (m, 4H), 1.88-1.74 (m, 4H), 1.56-1.42 (m, 2H).

(4,4-difluorocyclohexyl)amine (0.691 g, 5.11 mmol) was dissolved in dry toluene (5.0 mL) under Ar. Upon cooling to 0 °C trimethylaluminium (2.5 mL, 2 M in toluene, 5.0 mmol) was added dropwise. After the addition of Me₃Al was complete the ice bath was removed and the mixture was allowed to stir for 2 h at ambient temperature; consequently, a ca 0.67 M solution of aluminium amide was obtained. A part of this solution (2.2 mL, 1.5 mmol, corresponding to ca 8 eq.) was added to ethyl 5,6-bis(4-chlorophenyl)-3-[(4,4-difluoropiperidin-1-yl)methyl]pyrazine-2-carboxylate (0.092 g, 0.18 mmol), which had been placed in a dry round flask under Ar. Heating at 50 °C for 19 h. Upon cooling to 0 °C toluene (ca 2 mL) was added before HCl (aq., 2 M, 2 mL) was slowly added (dropwise). The obtained mixture was allowed to stir at 0 °C for 1 h before it was transferred to a separation funnel with the aid of dichloromethane (30 mL) and water (30 mL). The organic phase was separated and the aqueous phase was extracted further with dichloromethane (3 x 10 mL). The collected organic phases were washed with water (10 mL) and brine (30 mL) before drying with MgSO₄. 25 Pharmacological Activity

Compounds of the present invention are active against the receptor product of the CB1 gene. The compounds of the present invention are active at the CB1 receptor (IC₅₀ <1 micromolar). Most preferred compounds have IC₅₀ <200 nanomolar. The affinity of the compounds of the invention for central cannabinoid receptors is demonstrable in methods

described in Devane et al., Molecular Pharmacology, 1988, 34,605 or those described in WO01/70700 or EP 656354. Alternatively the assay may be performed as follows.

10µg of membranes prepared from cells stably transfected with the CB1 gene were
5 suspended in 200µl of 100mM NaCl, 5mM MgCl₂, 1mM EDTA, 50mM HEPES (pH 7.4),
1mM DTT, 0.1% BSA and 100µM GDP. To this was added an EC80 concentration of
agonist (CP55940), the required concentration of test compound and 0.1µCi [³⁵S]-GTPγS.
The reaction was allowed to proceed at 30°C for 45 min. Samples were then transferred on
to GF/B filters using a cell harvester and washed with wash buffer (50mM Tris (pH 7.4),
10 5mM MgCl₂, 50mM NaCl). Filters were then covered with scintillant and counted for the
amount of [³⁵S]-GTPγS retained by the filter.

Activity is measured in the absence of all ligands (minimum activity) or in the presence of
an EC80 concentration of CP55940 (maximum activity). These activities are set as 0% and
15 100% activity respectively. At various concentrations of novel ligand, activity is calculated
as a percentage of the maximum activity and plotted. The data are fitted using the equation
 $y = A + (B - A) / (1 + ((C/x)^{UD}))$ and the IC₅₀ value determined as the concentration required
to give half maximal inhibition of GTPγS binding under the conditions used.

20 Selected examples of the present invention exhibit the following data:

Example 9: 1.8 nM

Example 27: 13.5 nM

Example 35 1.4 nM

25 The compounds of the present invention may provide additional benefits in terms of
potency, selectivity, bioavailability, half-life in plasma, blood brain permeability, plasma
protein binding or solubility compared to representative reference CB1 antagonists/inverse
agonist agents.

PCT/SE2004/000970

Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: **10**
because they relate to subject matter not required to be searched by this Authority, namely:
see next sheet
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.
